Flex PC in action

COMPUTER-DRIVEN VISUAL REINFORCEMENT AUDIOMETRY

Ditch the remote control.

Flex PC turns your computer into a VRA controller. Trigger visual reinforcement straight from your keyboard while you keep working in your existing audiometry software.

VRA integration with any PC audiometer

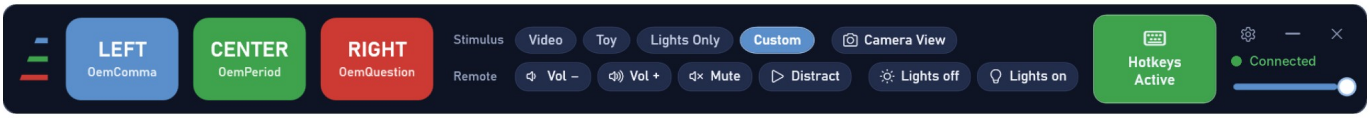

Ideal for clinics that prefer computer-based workflows or want to eliminate handheld remotes from the test room. A small USB transmitter sends each activation wirelessly to your Flex VRA monitors and toys.

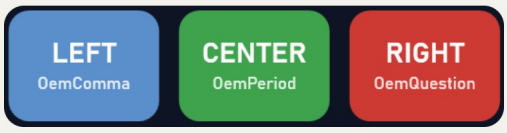

INCLUDED

At no extra cost with every Flex VRA system

Every control on one slim bar.

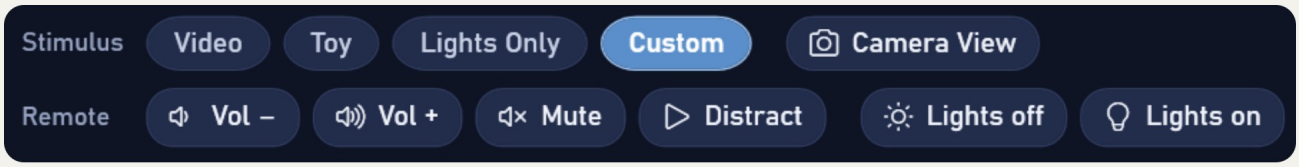

Flex PC sits along the bottom of your screen, just above the taskbar, and can stay on top of your audiometry software.

Left, center and right on your keys

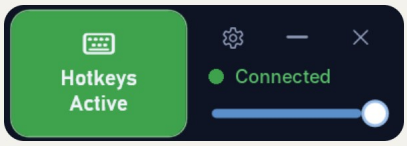

Assign any key to each side, with Ctrl, Shift or Alt if you like. Hold the key to reinforce for as long as you press, or switch to timed activation.

The whole remote, on screen

Choose Video, Toy, Lights Only or Custom, change the volume, mute, start Distract and switch the lights, all with a click.

Camera View works with the optional Flex Cam in-booth camera (FLEX-CAM, **$500** list): see the booth on your screen and record a session with one click.

Always ready, never in the way

Hotkeys keep working while your audiometry software is in front. Pause them with one click, fade the bar with the slider, and a green light confirms the transmitter is connected.
