About Flex VRA

Listening to clinicians from the start.

Flex VRA was built to support how pediatric audiology is practiced today.

From the beginning, our focus has been on helping audiologists maintain attention, reduce distraction, and adapt testing to the needs of children.

Founded in 2017, Flex VRA began as a response to a simple question from the field. That question led to a prototype that allowed clinicians to tailor content and environment in real time to improve engagement and test efficiency.

The positive response from audiologists shaped what Flex would become. Each request from clinicians became an opportunity to improve. Features like user-uploaded content, audiometer integration, and expanded testing modes were added in direct response to real-world use.

Today, Flex VRA supports hearing tests in over 1,500 clinics. That growth has been driven by close collaboration with audiologists and a commitment to listening, adapting, and improving.

Each feature added to Flex VRA reflects clinical feedback from audiologists working with pediatric patients every day. By focusing on usability, flexibility, and engagement, Flex VRA continues to evolve by listening to clinicians and families, one test at a time.

THE QUESTION THAT STARTED IT, 2017

"Is there a better way to control what appears on a VRA screen during testing?"

1,500+

clinics testing with Flex VRA today

Why Flex VRA?

Faster tests. Better outcomes.

EVERY FLEX VRA SYSTEM
MUST BE...

01 Engaging

Pediatric patients are discerning. Static lights and outdated visuals struggle to compete with the stimuli children experience every day. Flex VRA uses dynamic, modern visual reinforcement built to capture attention and maintain engagement throughout testing.

02 Fast and reliable

Every second matters in pediatric testing. Flex VRA systems respond instantly and are ready whenever the child is ready to test, minimizing delays and missed opportunities.

03 Supported

Flex VRA support begins on installation day and continues throughout the life of the system. You're not just purchasing hardware. You're partnering with a long-term support team.

04 Simple and integrated

Flex VRA integrates seamlessly with compatible audiometers and PC-based workflows. Every system ships with integration hardware, so clinicians control reinforcement quickly without breaking focus during testing.

"We build solutions for the parents of the child being tested. If we provide tools for audiologists that help give those parents answers about their child's hearing, we'll always have a customer."

Steve Smith, Customer Service Support

TRANSPARENT DISPLAY VRA

Flex Halo

Video + toy. One system.

Flex Halo is a next-generation visual reinforcement audiometry (VRA) solution that combines the engagement of video with the realism of physical toys in a single, compact unit. Using a transparent display, Flex Halo creates the effect of lifelike toys appearing to spin in mid-air while also delivering high-contrast video content. The result is a unique, attention-grabbing stimulus that helps clinicians maintain engagement and obtain more reliable responses during pediatric hearing evaluations.

Every Flex Halo system includes

- ✓ 2 remote controls (normal and glow-in-the-dark)
- ✓ Flex PC (computerized audiometer users)
- ✓ 1-year warranty
- ✓ Audiometer integration cable (GSI AudioStar Pro or Interacoustics EVO)
- ✓ Built-in conditioned play audiometry games

VIDEO + TOY IN ONE SYSTEM

Combination systems

VRA for any age.

Flex VRA combination systems allow clinicians to test a wider patient age range using a single remote control. For younger patients, Flex Toy provides engaging visual reinforcement. For older patients, Flex Video monitors deliver age-appropriate content. Clinicians can easily switch between both on any patient, maximizing engagement and reducing test times.

Lets the patient actively participate in play audiometry using a wireless, battery-free VROCA (Visual Reinforcement Operant Conditioning Audiometry) button. Kinetic energy from the button press powers the wireless signal to the Flex VRA monitor, so there are no batteries or cables. The audiologist can also suppress the button until the patient understands the instructions and is cooperative.

INCLUDES

Push button
USB receiver dongle for Flex VRA
Instruction guide
1-year warranty

Flex Screen Mirror

FLEX-SCREENMIRROR

LIST PRICE

\$825

Turns one VRA monitor into an in-booth display. Mirror any HDMI video source (AudioStar Pro, computer or other input) to the VRA screen, for testing inside the booth or counseling parents with audiograms and test results. Setup uses the included HDMI cable, and mirror mode toggles on or off from the touch screen.

Bonus: with compatible equipment, an otoscope feed can also be viewed inside the booth.

INCLUDES

Flex video input
15 ft HDMI cable
Wireless mouse and keyboard
1-year warranty

Flex-Cam

FLEX-CAM

LIST PRICE

\$500

Flex-Cam shows a live view of the test room in a compact window on your computer, so you can watch every head turn while you test. Pin the window on top of your audiometer software, adjust its transparency, flip the image, and record a session with one click.

INCLUDES

In-booth camera
Flex Cam software
1-year warranty

TOY-BASED VRA, MADE WIRELESS

Flex Toy VRA

Engagement through variation.

Flex Toy brings traditional toy-based reinforcement into a modern, fully wireless VRA system, designed to keep children engaged while keeping clinical workflows simple and flexible. It delivers reliable wireless activation without line-of-sight limitations, clear and localized audio reinforcement, and full software control without requiring any changes to your existing workflow. Thoughtfully engineered for daily clinical use, Flex Toy is built for long-term reliability you can trust.

Every Flex Toy VRA includes

- ✓ 2 remote controls (assistant and/or backup remote)
- ✓ Audiometer integration cable (GSI AudioStar Pro or Interacoustics EVO)
- ✓ Flex PC (computerized audiometer users)
- ✓ 1-year warranty

Fully wireless and easy to install

REMOTE-CONTROLLED WINDOW COVER

Flex Cover

Be heard. Not seen.

Flex Cover reduces visual distractions through sound booth windows while preserving clear clinician visibility of the patient. The magnetic, remote-controlled cover lets the audiologist see into the booth while preventing the patient from seeing out, helping maintain focus during testing.

Flex Cover is battery powered and rechargeable, with flexible power options for periodic charging or continuous use. Installation is simple and non-invasive. The Window Cover fits standard booth windows; the Door Cover fits the larger window panels common on sound booth doors.

AUDIOMETRIC SPEAKERS

Flex Speaker

Designed for audiology.

Mount it right the first time.

Integrated mounting magnets let each speaker be positioned on the booth wall before final securing, so left and right speakers sit at the same height and spacing.

Measured and matched. An included measuring tape sets both speaker cones at an equal distance from the floor. A small standoff gap leaves room for cable routing, and pre-drilled points allow corner or flat-wall installation without extra brackets.

Wired for your audiometer. Speaker wire is included. The GSI and EVO versions add a custom adapter cable that converts the audiometer's standard outputs to terminal block connections.
