Why Flex VRA?

Faster Tests. Better Outcomes

Flex VRA is designed around the moment that matters most in pediatric hearing care: when a child, their family, and the audiologist all need the test to work quickly and smoothly. When children feel comfortable and engaged, audiologists can obtain reliable results faster. When results are clear, parents understand their child's hearing needs with confidence.

Flex VRA supports that entire chain, from the family in the booth to the clinician administering the test, and the clinic delivering care efficiently every day. As trust builds from the patient to the clinician, from the clinician to distribution partners, and from our distribution partners to Flex VRA, we exist to support every link in that process.

Every Flex VRA System must be:

Engaging

Pediatric patients are discerning. Static lights and outdated visuals struggle to compete with the stimuli children experience every day. Flex VRA uses dynamic, modern visual reinforcement built to capture attention and maintain engagement throughout testing. Keeps kids engaged longer, reducing false starts and incomplete tests.

Fast and Reliable

Every second matters in pediatric testing. Flex VRA systems respond instantly and are ready whenever the child is ready to test, minimizing delays and missed opportunities. Less waiting, fewer resets, faster sessions.

Supported

Flex VRA support begins on installation day and continues throughout the life of the system. Whether clinics need configuration help, workflow optimization, or quick answers, support is designed to be responsive and practical.

You're not just purchasing hardware. You're partnering with a long-term support team.

Simple and Integrated

Flex VRA integrates seamlessly with compatible audiometers and PC-based workflows. Every system ships with the required integration hardware, allowing clinicians to control reinforcement quickly without breaking focus during testing.

Works with existing setups. No complicated learning curve.

Flex VRA® is a registered trademark. Used in pediatric audiology clinics worldwide.

FLEX TOY WIRELESS

The Flex Toy is now wireless, simplifying installation and reducing cable clutter in the booth. A magnetic mounting option allows for quick placement and easy repositioning when needed.

Flex Toy uses the same power source as any Flex monitor, meaning only one to two power cables are required to run a complete six-reinforcer setup.

The integrated LED light panel automatically cycles through visual patterns with each activation, increasing novelty and helping maintain patient attention throughout testing.

Wireless installation. Fewer cables. Higher engagement.

FLEX SPEAKER

Flex Speaker is designed for consistent, efficient installation across test booths. A magnetic backing allows speakers to be positioned on the wall prior to mounting, simplifying setup and alignment.

Each Flex Speaker can ship with audiometer adapter cables to ensure compatibility and easy connection across supported systems.

Simple installation. Clean integration. No added complexity.

Combination/ Hybrid Systems

Commonly specified Flex VRA system configurations offered under a single part number to simplify ordering.

All configurations include audiometer integration cables, Flex PC wireless computer control, remote controls (2), and installation hardware unless otherwise noted.

Flex VRA Video Systems

13.5" monitors with integrated LED light bar and wireless control

Flex VRA Video Systems provide clinicians with a modern, flexible approach to visual reinforcement during pediatric testing. Each 13.5" monitor features an integrated 360-degree LED light bar and wireless control, allowing for precise, low-latency reinforcement throughout the test.

Clinicians can select reinforcement modes directly from the remote, including Video, Simulated Toy, Lights Only, and Custom Content. Custom content may be uploaded by the user or selected from built-in Hey Bear Sensory options, allowing the system to adapt to a wide range of patients and testing environments.

All Flex VRA Video Systems are designed to integrate seamlessly with compatible audiometers and include the required audiometer integration cable (GSI Audiostar Pro and Interacoustics EVO), Flex PC wireless computer control, and installation hardware.

All configurations include audiometer integration cables, Flex PC wireless computer control, remote controls (2), and installation hardware unless otherwise noted.

Options and Accessories

For Flex Video VRA Monitors

There are two optional accessories available for Flex VRA Video Systems: Flex Screen Mirror and the Flex VROCA Button. These accessories are ordered with the system when desired and are not included as standard components.

Flex Wireless Battery-Free VROCA Button

Allows the patient to actively participate in play audiometry using a wireless, battery-free VROCA (Visual Reinforcement Operant Conditioning Audiometry) button. Kinetic energy generated by the button press powers the wireless signal to the Flex VRA monitor, eliminating the need for batteries or cables.

The audiologist may also temporarily suppress button activation until the patient understands the instructions and is cooperative.

FLEX-BUTTON \$800

Wireless Battery-Free Button

Includes:

Yellow Button

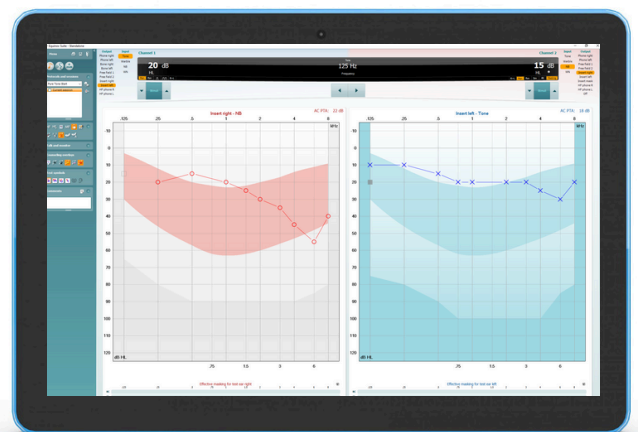

Receiver USB Dongle for Flex VRA
Instruction Guide

Flex Screen Mirror

Turns one VRA monitor into an in-booth display using Flex Screen Mirror. This allows the audiologist to mirror any HDMI video source (Audiostar Pro, computer, or other input) directly to the VRA screen.

Screen Mirror is commonly used for testing inside the booth or for counseling parents by displaying audiograms and test results. Setup is simple using the included HDMI cable, and screen mirror mode can be toggled on or off directly from the touch screen.

Bonus: With compatible equipment, an otoscope feed can also be viewed inside

FLEX-SCREENMIRROR \$800

Flex Screen Mirror Kit

Includes:

Video Capture Card

15 ft. HDMI Cable

Wireless Mouse and Keyboard

Flex Toy

Engagement Through Variation

Flex Toy has been redesigned to provide a wireless, easy-to-install reinforcement option that emphasizes engagement through variation. The integrated LED panel displays a rotating set of light patterns on each activation, helping maintain patient interest throughout testing.

All Flex Toy boxes include sound, distraction mode, and seamless integration with audiometer integration cables and Flex PC. Flex Toy ships standard with our custom built-in character (Dog, Cat, and Bus), with optional character upgrade kits available.

Flex Mobile

VRA Wherever You Need It

A 13.5" Flex VRA monitor with an integrated LED light bar designed for portable use. Flex Mobile provides the full functionality of a standard Flex VRA system and ships with a fold-up tabletop stand and carrying case for portable use. These have been used for Cochlear Implant Mapping rooms, taken between sound booths in the same facility, and also travel well for mobile audiology.

Each Flex Mobile ships with two remote controls and Flex PC.

Power requirement: Standard AC power outlet required.

FLEX-MOBILE

Portable VRA System with Tabletop Stand

Add-on options:

FLEX-VROCA \$800

FLEX-SCREENMIRROR \$800

\$2,450

Flex Cover

Soundbooth Window Covers

Flex Cover helps reduce visual distractions through sound booth windows while maintaining clinician visibility of the patient. The magnetic, remote-controlled window cover allows the audiologist to see into the booth while preventing the patient from seeing out.

Flex Cover is battery powered and rechargeable, with flexible power options for periodic charging or continuous use. Installation is simple and non-invasive. The Flex Window Cover is sized for standard booth windows, and the Flex Door Cover is designed to cover larger window panels commonly found in booth doors.

Note: For best results, dim or turn off lights outside the booth while testing with interior booth lights on.

FLEX-WINDOWCOVER

\$800

Flex Cover for Viewing Window

Includes:

- 3 ft x 3ft Window Cover
- Magnetic Mounts
- Remote Control
- USB C Charger

FLEX-DOORCOVER

\$800

Flex Cover for Booth Door Window

Includes:

- 5 ft x 18 in Window Cover
- Magnetic Mounts
- Remote Control
- USB C Charger

Flex Speaker

Easy to Install Audiometric Speakers

Flex Speaker is designed to provide a clean, consistent speaker installation for audiometric testing. Each speaker includes integrated mounting magnets that allow the speaker to be positioned on the booth wall prior to final securing, helping ensure consistent left and right speaker height and spacing.

The included measuring tape allows both speaker cones to be placed at equal distance from the floor, while a small standoff gap between the wall and speaker provides clearance for cable routing when needed. Flex Speaker includes pre-drilled mounting points for corner or flat-wall installation without the need for additional brackets.

Each speaker ships with speaker wire and a custom adapter cable compatible with GSI Audiostar Pro and Interacoustics EVO, converting outputs to terminal block connections for simplified installation.
